## MEMORY FOAM

### A Revolution in Sleeping Comfort

Celsius cm is a remarkable new memory foam which shapes to fit, eases pressure on the body and delivers support and comfort.

Celsius cm, Visco-Elastic Cellular Polymer, has the desirable qualities of being both energy absorbing and temperature sensitive. When exposed to the heat and weight of the body, the foam reacts by softening up and shaping itself to the outline of the body, offering optimum support and pressure relief. The body sinks into the foam until the weight is distributed evenly to the entire supporting surface.

It can be used with a conventional spring system or with a high density mattress foam. This gives support and flexibility to the Celsius cm upper layer, ensuring superb comfort, stability and durability, giving a good nights sleep.

Memory foam was originally developed for the American space industry to provide increased comfort and pressure relief to astronauts.

Now widely used in domestic bed mattresses the properties of the foam have been adapted directly in the health and nursing sector.

So test the sit allowing a few minutes for the foam to warm and mould to your body shape!
